QUALITY OF LIFE

Urologic Disorders & Pelvic Health

The medical technology industry is continually advancing and developing new innovations that improve the health and well-being of patients worldwide.

Urologic disorders such as male stress urinary incontinence (SUI), enlarged prostate (BPH) and erectile dysfunction significantly affect quality of life for men, limiting intimacy and self-esteem.

Together, these disorders affect more than 50 million men in the U.S. alone, and can be a result of prostate cancer treatments; conditions such as diabetes and heart disease; and pelvic trauma or surgery, among others.

Medical technology interventions and treatments for urologic disorders – including penile implants, artificial urinary sphincters, urethral lifts, male slings and laser therapy – provide alternatives to drugs and may offer more permanent, long-term solutions, ultimately leading to enhanced quality of life.

92% of people with **erectile dysfunction** reported sexual activity with the penile implant to be **excellent** or **satisfactory**.¹

For patients with mild to severe **SUI** treated with a sling published long-term success rates are **62 to 77 percent**.^{2,3}

In one study of patients treated with a **sling**:⁴

were cured

would undergo the procedure again

would recommend the procedure to a friend

In another study of patients treated with an artificial **urinary sphincter**:⁵

reported satisfaction

would have the system placed again

would recommend the implant to a friend

For patients with **BPH**, treatment with **laser surgery vs. traditional surgical options** is associated with significantly **less chance** of severe blood loss⁶; same-day surgery in most cases⁷; and significantly faster recovery in typical cases.⁸
